

Discussion I: Strategic Science

- Should the survey data be made public?
- Should the survey overlap with ALMA bands (e.g. 3-mm)?
- ALMA didn't give priority to the 7-mm band so why should we?
- How much of the Galaxy can we detect in other transitions apart from CO?
- If not CO then should the survey target the CO regions?
- The survey should be fully sampled spatially.
- Is there a case for a legacy survey using existing data?
