

The University of Sydney

The Radio Supernova Remnant of SN 1987A at 20 Years of Age

Bryan Gaensler, Stephen Ng (USyd);
Lister Staveley-Smith (UWA);
Dick Manchester, Mike Kesteven,
Lewis Ball, Tasso Tzioumis (ATNF)

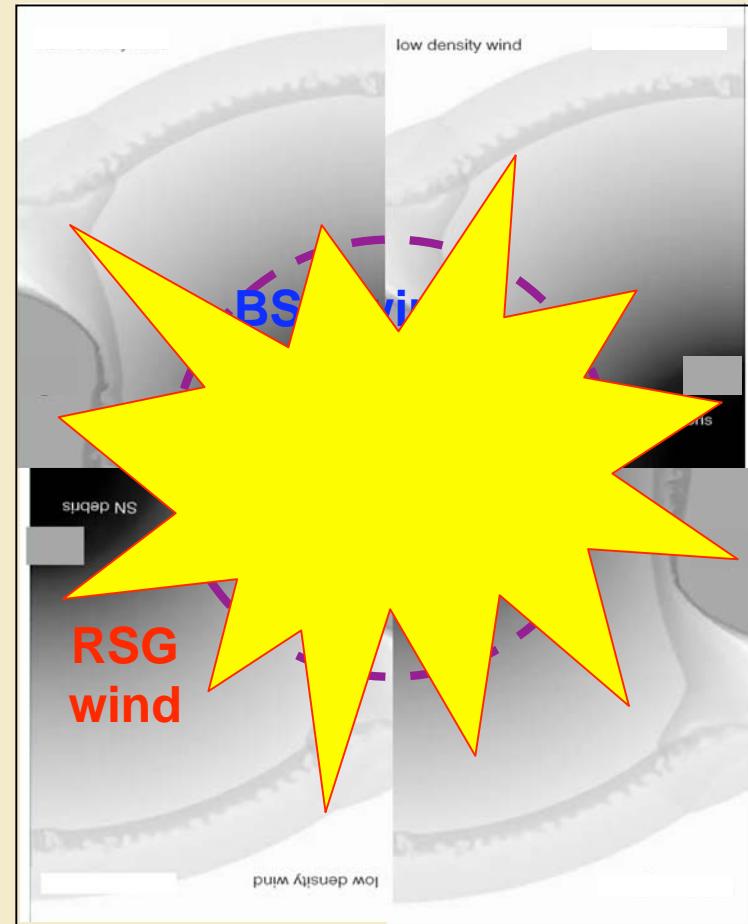

Circumstellar Structure

- Dense slow red supergiant wind, concentrated into equatorial plane
- High-velocity low-density isotropic blue supergiant wind for final $\sim 20\,000$ yr
- Blue supergiant photoionises red supergiant wind (Chevalier & Dwarkadas 1996)

HST WFPC2 (Pete Challis / SAINTS)

Hydro simulation (Michael et al. 2003)

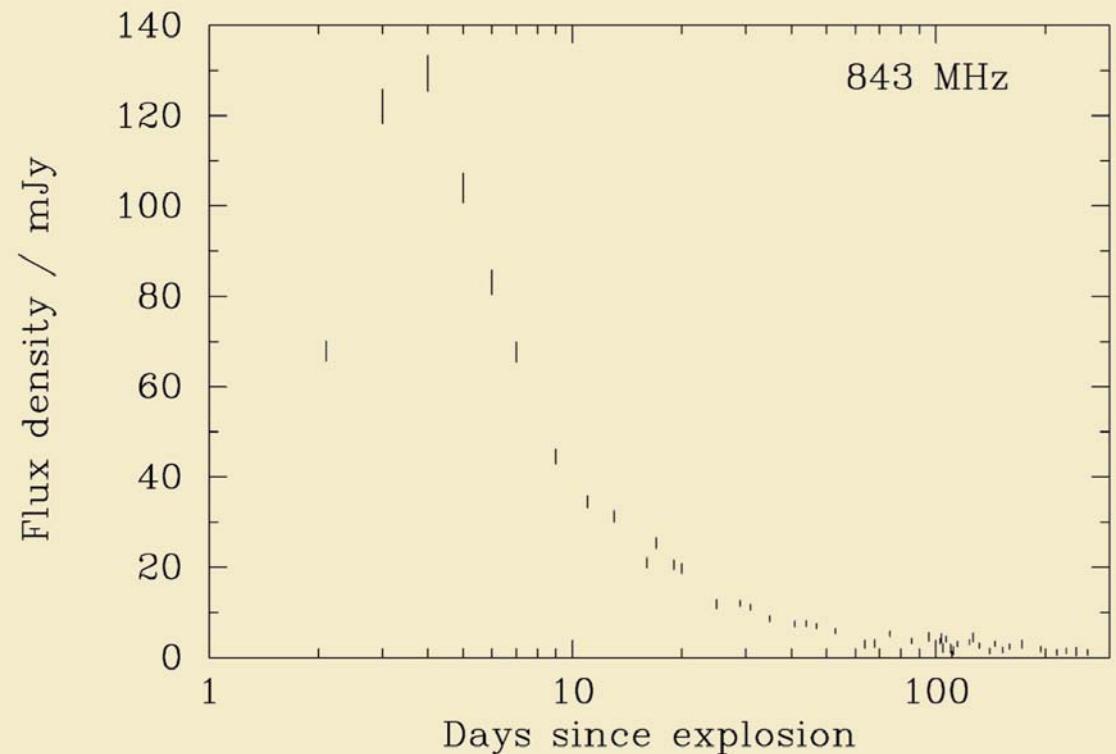

Prompt Phase

- Core collapse on 23 Feb 1987
- Burst of radio emission seen by MOST on day 2; peaked on day 4 (Turtle et al. 1987)
- Power law decay; faded by day 150
- Synchrotron in BSG wind ($\rho \propto r^{-2}$) (Storey & Manchester 1987; Chevalier & Fransson 1987)
- H α , VLBI: $V \sim 19000 - 30000$ km/s (Hanuschik & Dachs 1987; Jauncey et al. 1988)

Birth of a Supernova Remnant

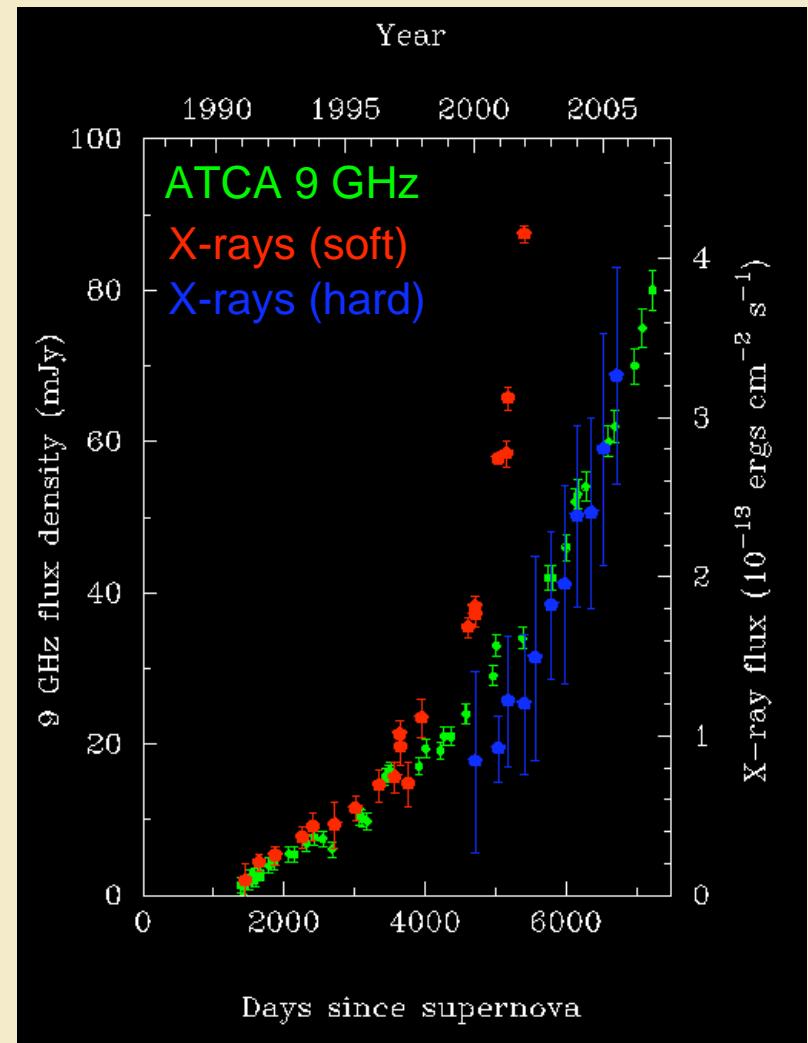

- MOST, & then ATCA, redetected radio emission in mid-1990 (day ~ 1200)

MOST (Douglas Bock)

ATCA (ATNF/CSIRO)

- Steady increase in flux over 17 years
- 9 GHz ATCA data ($\theta \approx 0.9''$) showed source was extended
(Staveley-Smith et al. 1992, 1993)
- Track size vs. time in $u-v$ plane:
first-order fit to thin spherical shell
(Staveley-Smith et al. 1993; Gaensler et al. 1997, 2007)

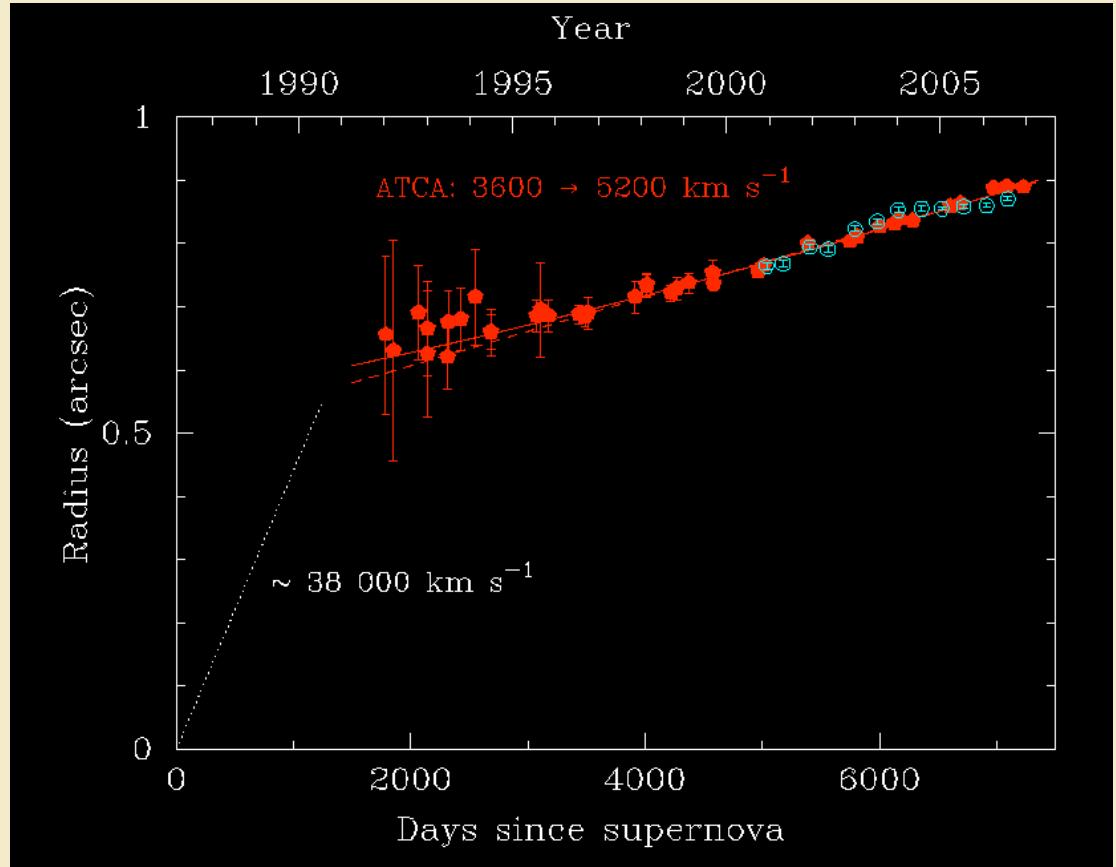

Staveley-Smith et al. (2007)

Expansion

- Shell was $\sim 1.3''$ (0.3 pc) across at day ~ 1800
 - mean expansion $\sim 38\,000 \text{ km/s}$ (1987-1992)
- Since day 1800, approx. constant expansion at $V = 4700 \pm 100 \text{ km/s}$
 - rapid deceleration
 - slightly better fit: quadratic increase from 3600 km/s to 5200 km/s
- Source now same size as optical ring
- Radius & velocity match *Chandra* X-ray data (Park et al. 2004, 2006, 2007)

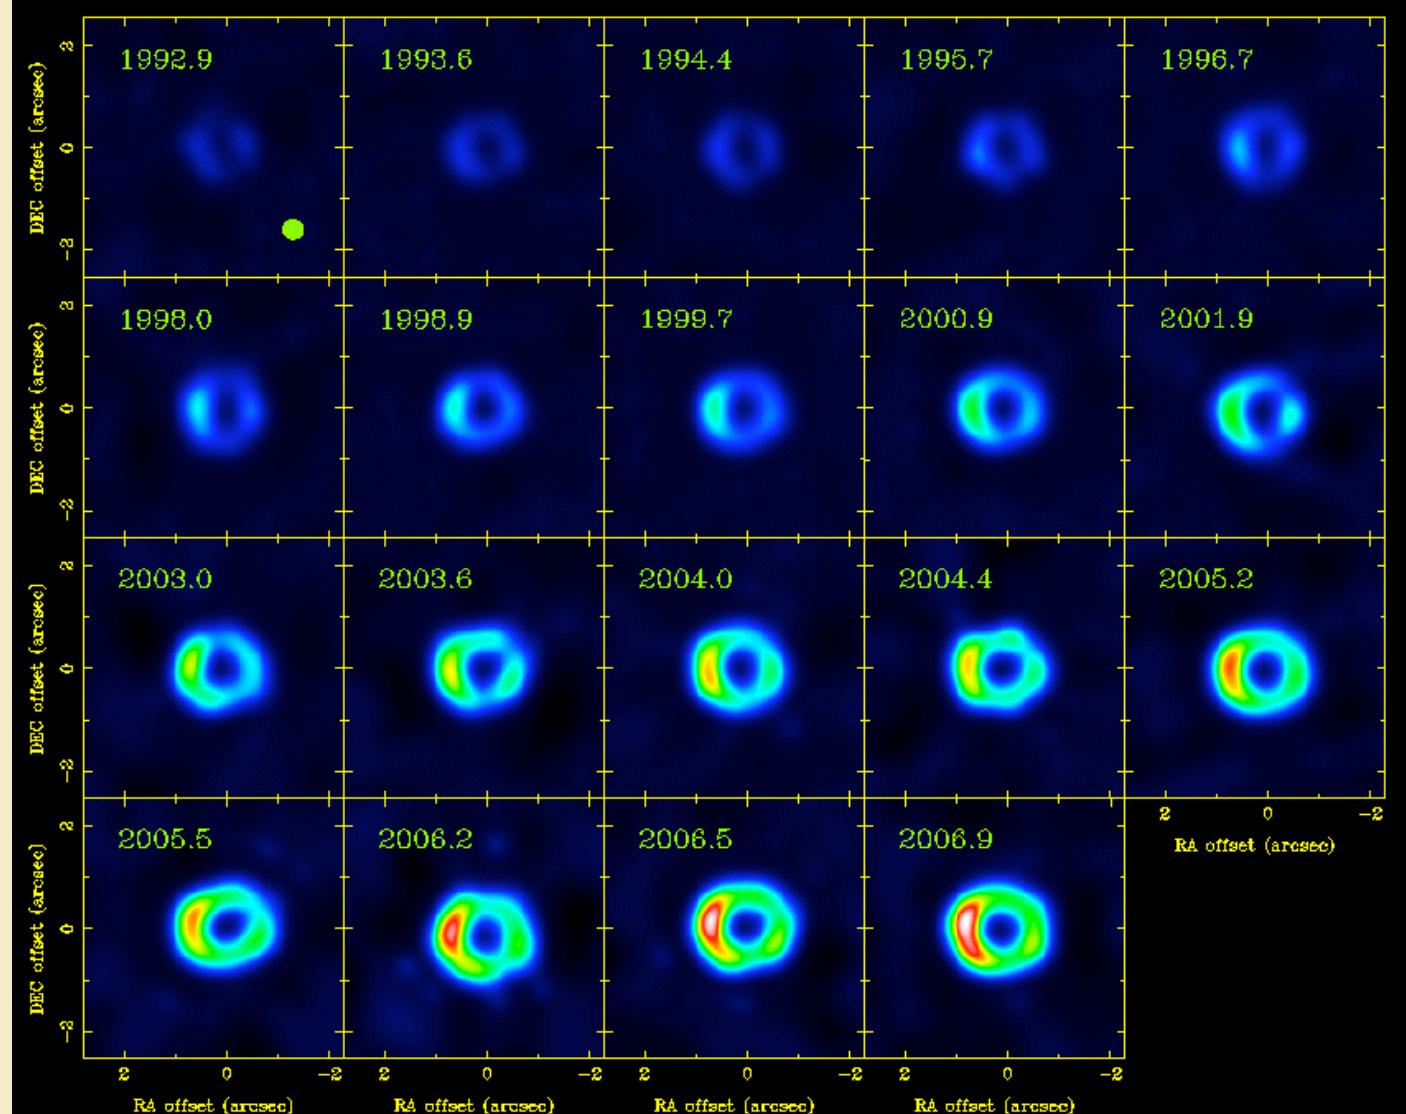

Gaensler et al. (2007)

Imaging & Super-Resolution

Gaensler et al. (2007)

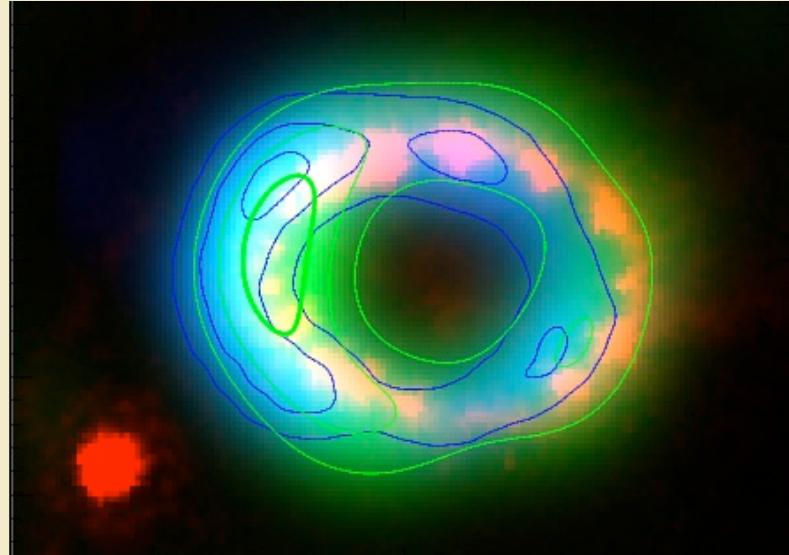

- Limb brightened
- Bright lobes to east and west
- Eastern lobe brighter than western lobe, & brightening faster

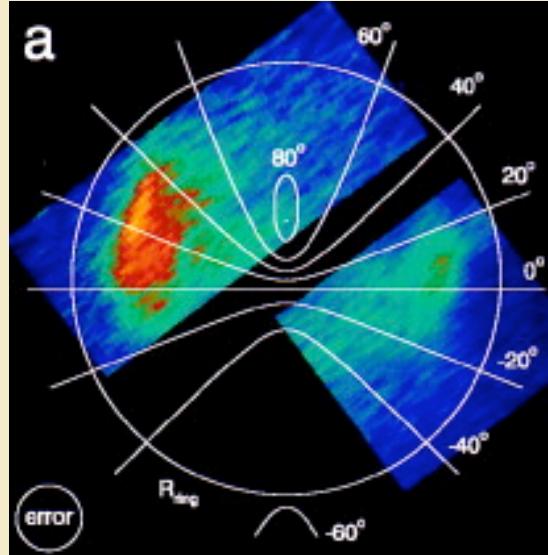

ATCA 9 GHz super-resolved (0.5 arcsec)

Multi-Wavelength Comparison

ATCA / *Chandra* / HST (day 6300)

STIS Ly α (Michael et al. 1998)

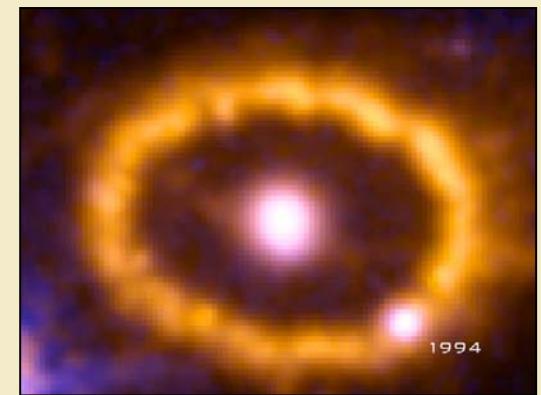

Michael et al. (2003)

- Two-lobed structures seen in radio, hard X-rays, optical
 - True morphology is likely a tilted ring
- Lobes align with major axis of ring
- Brighter lobe is at larger radius
 - Asymmetry in explosion/ejecta

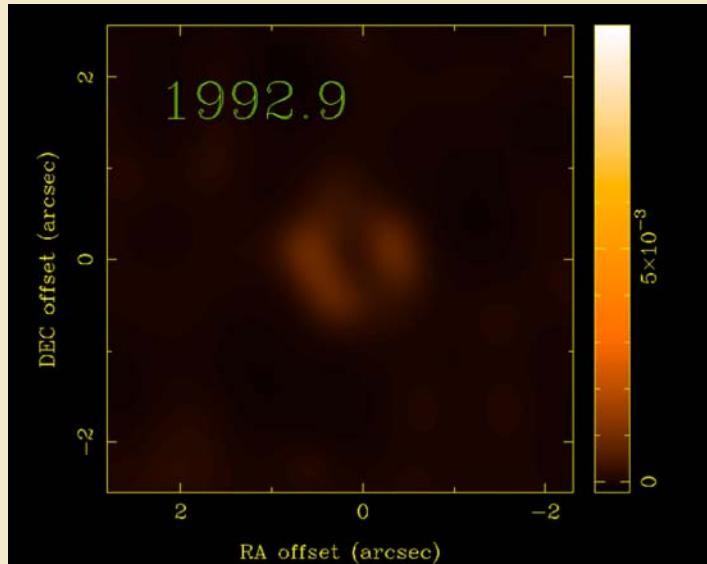

Conclusions

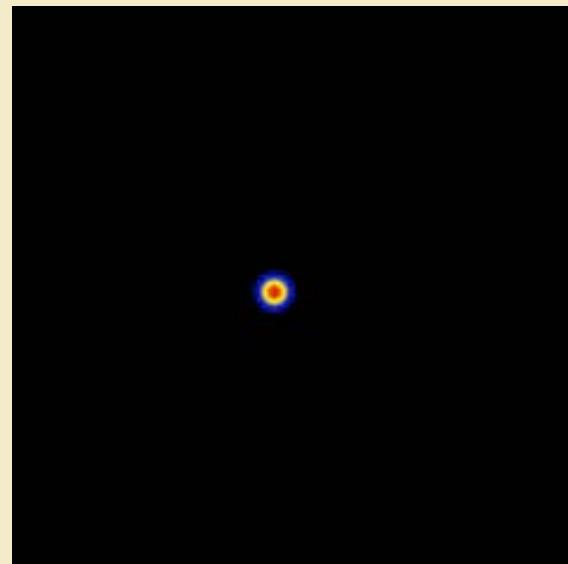

- Turn-on & deceleration of radio source due to impact with dense RSG wind
- Radio remnant of Supernova 1987A continues to steadily expand & brighten
- Consistent multi-wavelength picture of reverse-shock region:
 - limb-brightened shell expanding at $V \sim 5000$ km/s
 - interaction is with stellar wind in equatorial plane
 - collision of ejecta piston with dense optical ring now upon us!
- The Future: ALMA, ASKAP, SKA
